

INSTRUCTIONS FOR FILL WATER BAG

Before filling the bag with water, we recommend hanging it in the place of use otherwise, once full, it will be very difficult to move and install. For optimal height, the top of the water ball should be at the height of the user's head.

1. With a screwdriver unscrew the black cap.

2. Once the cap is removed, a transparent safety valve will be visible. The latter must be removed. Help yourself by pushing it from behind or pull it out with another tool

3. After removing the valve, insert the nozzle for the hose. The end in the figure must be inserted into the hole, the other into the rubber tube of the water pipe. Add a few drops of bleach to prevent decay of the water inside.

4. After filling the water ball, be careful to reinsert the safety valve first and then screw the cap back on.
